

Fire Ant Eliminator: General Application Instructions

10 Mil. Beneficial Nematodes - Treats 10 Colonies:

Best temperatures to apply: Air temperature from 40° F to 85° F. Soil temperatures (at 2" depth) should be above 42 F and below 85° F.

1. Add 1 cup water with the contents of the nematode container and allow to sit for 30 min.
2. Combine entire contents with 1-5 more gal. of cold water in a watering can with rosette removed.
3. Caution: Steps 4 and 5 should be completed quickly, then immediately leave the area.
4. Pre-water colony to be treated by pouring one-gallon cold water down the cone.
5. While swirling watering can, pour 1/10th of the mixture down the middle of the cone. The nematodes will either penetrate and kill the fire ant queens or kill so many workers that the colony will starve.
